SiteSense · 5-minute presentation script

Triwizathon · Round 2 Development Phase · Walchand College of Engineering

Suyash Patil · Harshad Khatale · Tanuja Saravale · Madanaj Sagar

How this script matches the evaluation sheet (30 marks)

Criterion (10 marks each)	What the judges look for	Where we show it
1. Development progress and implementation	Substantial progress since Evaluation 1; core features built as planned; milestones achieved	0:25 – 1:20 progress; the live demo proves it works
2. Technical quality and problem solving	Good technology choices, sound architecture, clean code, solving technical challenges, using mentor feedback	3:20 – 4:20 technology and problems solved; 4:20 mentor feedback
3. Demonstration and team understanding	Working features, reasons for decisions, each member's contribution, clear roadmap	1:20 – 3:20 demo; 4:20 team; 4:40 roadmap

Timeline

Time	Part	Who	Criterion	Words
0:00 – 0:25	Opening	Speaker 1	–	52
0:25 – 1:20	Progress since Evaluation 1	Speaker 2	Criterion 1	126
1:20 – 1:50	Demo 1: find the best sites	Speaker 3	Criterion 3	60
1:50 – 2:30	Demo 2: understand one site	Speaker 3	Criterion 3	73
2:30 – 2:55	Demo 3: what-if	Speaker 3	Criterion 3	49
2:55 – 3:20	Demo 4: expansion plan	Speaker 3	Criterion 3	44
3:20 – 4:20	Technology and problem solving	Speaker 4	Criterion 2	126
4:20 – 4:40	Team and mentor feedback	Speaker 4	Criterion 3	28
4:40 – 5:00	Roadmap and close	Speaker 1	Criterion 3	41
Total				**599** (≈ 5:00 at 120 words/min)

The problem in one line (judges already know it)

“Help a retail chain choose the best location for its next store using AI, and explain why.” We say this once and move on.

Numbers you can quote

15,350	6,541	5	9	17
real places used	hexagon zones	business types	AI parts working	product features

Before you present

- **Fill the yellow brackets** on the team slide: who built what, and one sentence on mentor feedback. We did not invent these.
- Check the claim “first prototype ran on made-up data” matches what you showed in Evaluation 1. Change it if not.
- Start both servers (*run-backend.bat*, *run-frontend.bat*) and open http://localhost:5173. Do one practice search so the data is warm.
- Pick **Pharmacy** for the demo: it uses all the learned models. Do not start with Sports (it uses the simple method).
- Practise once with a timer. If you run long, shorten the technology part, not the demo.

The script

0:00 – 0:25 Opening

Speaker 1 · 52 words · about 26 s

SAY Good morning. We are Team SiteSense from Walchand College of Engineering. Our problem statement is simple: help a retail chain choose the best place for its next store, using AI. Today we will show what we built since the last evaluation, how it works, and what comes next for the final submission.

DO Stay on the home screen. No clicking yet.

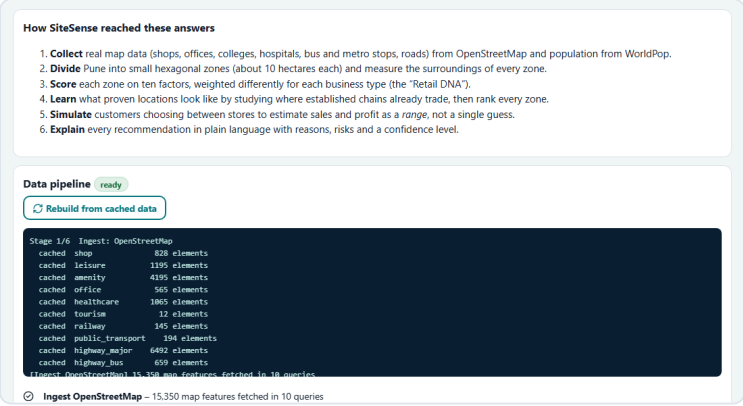

0:25 – 1:20 Progress since Evaluation 1

Criterion 1: Development progress (10 marks)

Speaker 2 · 126 words · about 63 s

SAY First, our progress. Our first prototype ran on made-up city data. Since then we have rebuilt it on real data. We now use more than 15 thousand real places from OpenStreetMap, like shops, offices, hospitals, bus stops and roads. We add real population data from WorldPop, about seven million people. We split Pune into six and a half thousand small hexagon zones, and we measure what surrounds each one. The app now covers five business types: sports, food, fashion, pharmacy and electronics. Nine AI parts are working, from ranking to profit simulation to explanations. We also redesigned the screen so a shop owner can follow every step. And everything about a city or a business now lives in a simple settings file, not in the code.

DO Open the **4 Data & trust** tab and point to the pipeline list and the counts.

Data & trust tab: the six pipeline steps and where each number comes from.

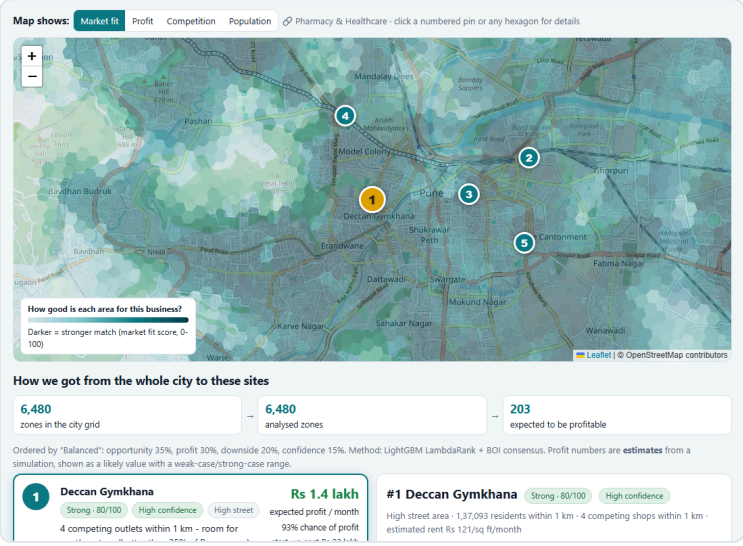

1:20 – 1:50 Demo 1: find the best sites

Criterion 3: Demonstration (10 marks)

Speaker 3 · 60 words · about 30 s

SAY Now the demo. I choose what I sell: pharmacy. I can set limits like budget or rent, or I can simply type a sentence in the Just ask box. Then I press Find best locations. In a few seconds the map shows how good every area is. Darker means a better match. The numbered pins are the top five sites.

DO Click **Pharmacy**, then **Find best locations**. Point at the map, the pins and the strip that shows how the city was narrowed down.

Find sites: hexagon map, ranked pins, the strip showing how 6,480 zones were narrowed down, and the first site card.

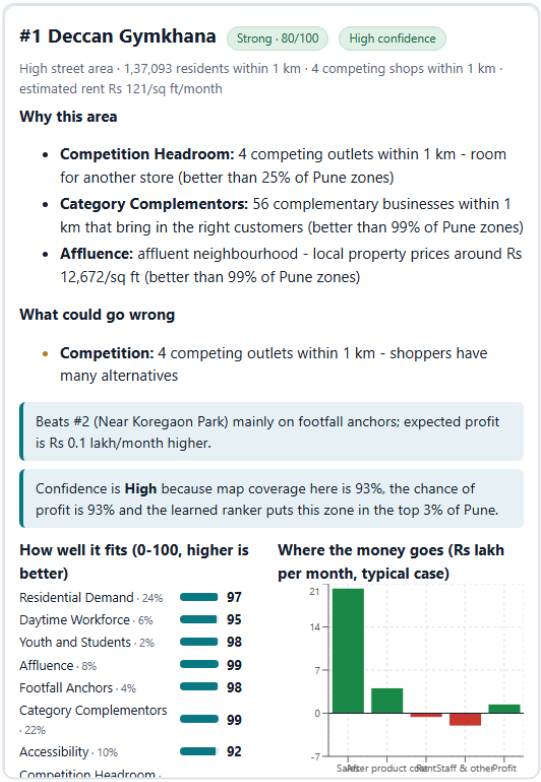

1:50 – 2:30 Demo 2: understand one site

Criterion 3: Demonstration

Speaker 3 · 73 words · about 36 s

SAY Here is site number one, near Deccan Gymkhana. It shows the expected profit as a range: a weak case, a likely case and a strong case. We never give one made-up number. On the right we explain why: many helpful businesses nearby, an affluent area, and room for another store. Below that we show the risks, a confidence level, and why this site beats number two. Every figure is labelled real or estimated.

DO Click pin **1**. Point at *Why this area*, *What could go wrong* and the confidence note.

Site detail: reasons, risks, confidence and a comparison with the next site.

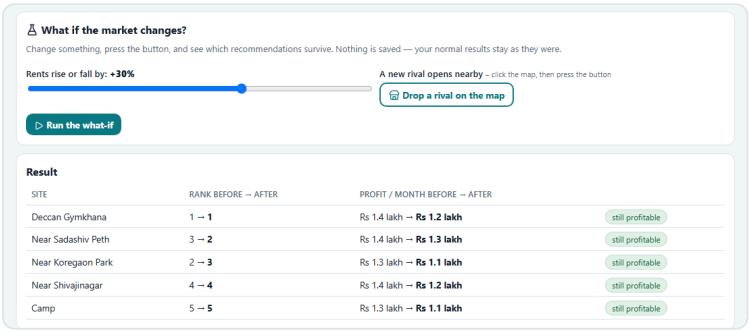

2:30 – 2:55 Demo 3: what-if

Criterion 3: Demonstration

Speaker 3 · 49 words · about 24 s

SAY Next, what-if. If rents rise thirty percent, we re-run everything. Profits fall, and sites two and three swap places. An owner can also drop a new rival on the map. And if you add your own stores, we estimate how much a new store would take sales from them.

DO Open **2 What-if**, move the slider to +30%, press **Run the what-if**.

What-if: rents +30%. Sites 2 and 3 swap places and profits drop.

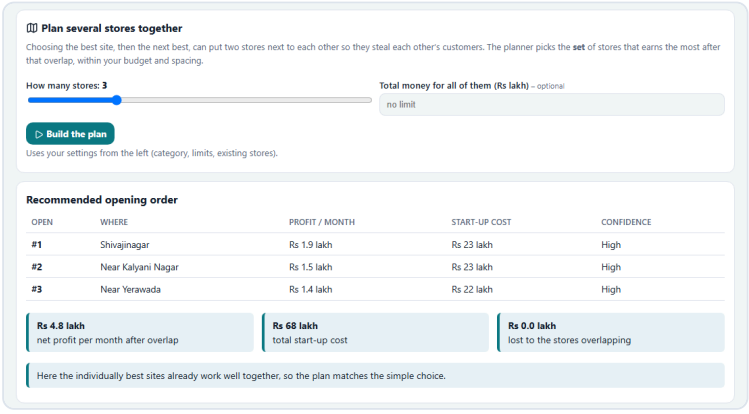

2:55 – 3:20 Demo 4: expansion plan

Criterion 3: Demonstration

Speaker 3 · 44 words · about 22 s

SAY Last in the demo, the expansion plan. For three stores, the planner picks the best group together, so the stores do not steal each other's customers. The Data and trust page shows where every number comes from, and how well each model was tested.

DO Open **3 Expansion plan**, press **Build the plan**. Then flash the model-score table on the Data & trust tab.

Expansion plan: three stores chosen together, with total cost and overlap.

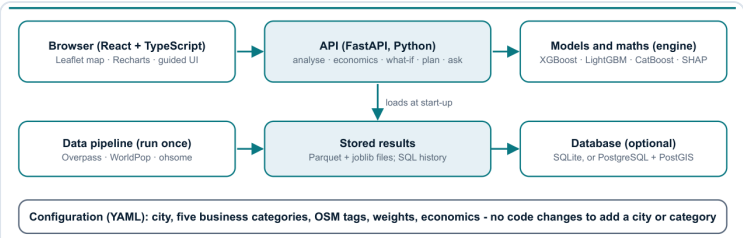

3:20 – 4:20 Technology and problem solving

Criterion 2: Technical quality (10 marks)

Speaker 4 · 126 words · about 63 s

SAY Now the technology. The front end is React with TypeScript and a Leaflet map. The back end is Python with FastAPI. For AI we use XGBoost, LightGBM and CatBoost, SHAP for explanations, and Google OR-Tools to plan several stores. We solved real problems along the way. The map data server kept failing, so we added retries and saved copies of the data. Our first profit numbers were too high, so we recalibrated the simulation. To stop the model from cheating, we hide the chain shops it learns from, and we test it on whole neighbourhoods it has never seen. Where data is too thin, like sports shops, the app says so and uses a simpler method. We also added tests, input checks and clear error messages.

DO Point at the architecture picture on the slide (or the overview PDF, page 5).

Architecture: the slow work runs once; the app then answers in seconds.

4:20 – 4:40 Team and mentor feedback

Criterion 3: Team understanding

Speaker 4 · 28 words · about 14 s

SAY Our team shared the work. [NAME 1] built the data pipeline. [NAME 2] built the models. [NAME 3] built the interface. [NAME 4] handled testing and documents. Following mentor feedback, we [ONE SENTENCE: what you changed].

DO Fill the square brackets before presenting. Each member says their own part in one sentence.

4:40 – 5:00 Roadmap and close

Criterion 3: Roadmap

Speaker 1 · 41 words · about 20 s

SAY For the final round we will use the exact city border, retry our growth data, test with real sales from one shop chain, add live rent listings, and put the app online. Thank you. We are happy to take your questions.

DO Return to the results screen.

If the judges ask (short answers)

Q. Is the data real?

The map data is real (OpenStreetMap, 15,350 places) and so is the population (WorldPop). Property prices, margins and spending per person are our own estimates, and the app labels them as estimates.

Q. Where does the profit number come from?

From a simulation of shoppers choosing between stores by distance and attractiveness, repeated 300 times with uncertain inputs. We have no real sales data, so it is decision support, not a guarantee.

Q. How do you know the AI works?

We tested on whole neighbourhoods the model never saw. It finds chain-like locations much better than population alone, for example pharmacy 52% against 8% (Data & trust page). That shows it finds proven-looking sites, not proof of profit.

Q. Why does Sports use a simpler method?

Only 25 sports shops are mapped in OpenStreetMap for Pune, so there are too few examples to learn from. The app says this and lowers its confidence.

Q. Is this just a chatbot?

No. The AI does the analysis: ranking, simulation and explanations. The Just ask box only reads the request and fills the form; it never writes the answers.

Q. What are the limits?

Study area is a rectangle, not the exact city border; the growth data was unavailable at build time; rent model is basic; no zoning or online-demand data.

Q. What will you do next?

Exact city border, real sales from one chain to calibrate, live rent listings, deployment online, reports and accounts.

Screenshots are from the running prototype (Pharmacy, Pune). Map © OpenStreetMap contributors.
